NEW QUESTION: 2

A certain strain of bacteria called *lyngbya majuscula*, an ancient ancestor of modern-day algae, is making a comeback in ocean waters just off the world's most industrialized coastal regions. This primitive bacteria has survived for nearly three billion years due to a variety of survival mechanisms. It can produce its own fertilizer by pulling nitrogen out of the air; it relies on a different spectrum of light than algae do, allowing it to thrive even in deep, murky waters; and when it dies and decays, it releases its own nitrogen and phosphorous, on which the next generation of *lyngbya* feeds. *Lyngbya* emits more than one hundred different toxins harmful to other ocean life as well as to humans. Commercial fishermen and divers who come in contact with the bacteria frequently complain of skin rashes and respiratory problems, which can keep these workers off the job for months at a time. The bacteria further disrupts local economies by blocking sunlight to sea grasses that attract fish and other sea life. Scientists attribute the modern-day reappearance of *lyngbya*, and the resulting problems, chiefly to nitrogen- and phosphorous-rich sewage partially processed at wastewater treatment plants and pumped into rivers that feed coastal ocean waters.

According to passage, the *lyngbya majuscula* strain

- I. depends largely on nitrogen and phosphorous as nutrients
- II. can harm other ocean life as a result of its high toxicity
- III. thrives mainly in waters where algae is largely absent

- A. III only
- B. I and II only
- C. II and III only
- D. I only
- E. I, II, and III

Answer: B

Explanation:

Nowhere in the passage does the author discuss algae, except to state (in the first sentence) that *lyngbya* is an ancestor of modern-day algae.

NEW QUESTION: 3
