NEW QUESTION: 1

Which of the following is an example of a false positive?

- A. The IDS does not identify a buffer overflow.
- B. Anti-virus identifies a benign application as malware.
- C. A biometric iris scanner rejects an authorized user wearing a new contact lens.
- D. A user account is locked out after the user mistypes the password too many times.

Answer: B

Explanation:

A false positive is an error in some evaluation process in which a condition tested for is mistakenly found to have been detected. In spam filters, for example, a false positive is a legitimate message mistakenly marked as UBE -unsolicited bulk email, as junk email is more formally known. Messages that are determined to be spam -- whether correctly or incorrectly -- may be rejected by a server or client-side spam filter and returned to the sender as bounce e-mail. One problem with many spam filtering tools is that if they are configured stringently enough to be effective, there is a fairly high chance of getting false positives. The risk of accidentally blocking an important message has been enough to deter many companies from implementing any anti-spam measures at all. False positives are also common in security systems. A host intrusion prevention system (HIPS), for example, looks for anomalies, such as deviations in bandwidth, protocols and ports. When activity

varies outside of an acceptable range - for example, a remote application attempting to open a normally closed port -- an intrusion may be in progress. However, an anomaly, such as a sudden spike in bandwidth use, does not guarantee an actual attack, so this approach amounts to an educated guess and the chance for false positives can be high. False positives contrast with false negatives, which are results indicating mistakenly that some condition tested for is absent.

NEW QUESTION: 2

An IS auditor reviewing the key roles and responsibilities of the database administrator (DBA) is LEAST likely to expect the job description of the DBA to include:

- A. liaising with users in developing data model.
- B. defining the conceptual schema.
- C. defining security and integrity checks.
- D. mapping data model with the internal schema.

Answer: D

Explanation:

Explanation/Reference:

Explanation:

A DBA only in rare instances should be mapping data elements from the data model to the internal schema (physical data storage definitions). To do so would eliminate data independence for application systems.

Mapping of the data model occurs with the conceptual schema since the conceptual schema represents the enterprise wide view of data within an organization and is the basis for deriving and end-user department data model.

NEW QUESTION: 3

An engineer wants to implement a network with the RSTP+ but the majority of the equipment is running STP. What will be the outcome when running STP and RSTP+ simultaneously?
