- D. Option C

Answer: A

Explanation:

Explanation

Elastic Beanstalk simplifies this process by managing the Amazon SQS queue and running a daemon process on each instance that reads from the queue for you.

When

the daemon pulls an item from the queue, it sends an HTTP POST request locally to `http://localhost/` with the contents of the queue message in the body. All that your application needs to do is perform the long-running task in response to the POST.
