NEW QUESTION: 1

You are working for a company and been allocated the task for ensuring that there is a federated authentication mechanism setup between AWS and their On-premise Active Directory. Which of the following are important steps that need to be covered in this process? Choose 2 answers from the options given below. Please select:

- A. Configure AWS as the relying party in Active Directory Federation services
- B. Ensure the right match is in place for On-premise AD Groups and IAM Roles.
- C. Configure AWS as the relying party in Active Directory
- D. Ensure the right match is in place for On-premise AD Groups and IAM Groups.

Answer: A,B

Explanation:

Explanation

The AWS Documentation mentions some key aspects with regards to the configuration of On-premise AD with AWS One is the Groups configuration in AD Active Directory Configuration Determining how you will create and delineate your AD groups and IAM roles in AWS is crucial to how you secure access to your account and manage resources. SAML assertions to the AWS environment and the respective IAM role access will be managed through regular expression (regex) matching between your on-premises AD group name to an AWS IAM role.

One approach for creating the AD groups that uniquely identify the AWS IAM role mapping is by selecting a common group naming convention. For example, your AD groups would start with an identifier, for example, AWS-, as this will distinguish your AWS groups from others within the organization.

Next include the 12-digit AWS account number. Finally, add the matching role name within the AWS account. Here is an example:

And next is the configuration of the relying party which is AWS ADFS federation occurs with the participation of two parties; the identity or claims provider (in this case the owner of the identity repository - Active Directory) and the relying party, which is another application that wishes to outsource authentication to the identity provider; in this case Amazon Secure Token Service (STS).

The relying party is a federation partner that is represented by a claims provider trust in the federation service.

Option B is invalid because AD groups should not be matched to IAM Groups Option C is invalid because the relying party should be configured in Active Directory Federation services For more information on the federated access, please visit the following URL: 1

The correct answers are: Ensure the right match is in place for On-premise AD Groups and IAM Roles., Configure AWS as the relying party in Active Directory Federation services Submit your Feedback/Queries to our Experts

NEW QUESTION: 2

You have an Azure subscription named Subscription1.

You plan to deploy an Ubuntu Server virtual machine named VM1

to Subscription1.

You need to perform a custom deployment of the virtual machine. A specific trusted root certification authority (CA) must be added during the deployment.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

Box 1: Unattend.xml

In preparation to deploy shielded VMs, you may need to create an operating system specialization answer file. On Windows, this is commonly known as the "unattend.xml" file. The New-ShieldingDataAnswerFile Windows PowerShell function helps you do this. Starting with Windows Server version 1709, you can run certain Linux guest OSes in shielded VMs. If you are using the System Center Virtual Machine Manager Linux agent to specialize those VMs, the New-ShieldingDataAnswerFile cmdlet can create compatible answer files for it.

Box 2: The Azure Portal

You can use the Azure portal to deploy a Linux virtual machine (VM) in Azure that runs Ubuntu.
