A. `switch(config)# vlan 10 name HMC`
`switch(config)# interface gigabitEthernet 1/24`
`switch(config-if)# no shutdown`
`switch(config-if)# ip address 10.10.10.1 255.255.255.0`
`switch(config-if)# ip helper-address 10.10.10.10`
`switch(config-if)# ip helper-address 10.10.10.11`

`switch(config-if)# ip helper-address 10.10.10.10`

Answer: D

Explanation:
Explanation

A switch can be partitioned to create a VLAN dedicated to HMC to managed server communication. If HMCs are configured as DHCP servers, there must be only one HMC on each VLAN! If dual HMCs are attached for redundancy, it is unwise to connect the HMCs to two VLANs in the same switch, because if the switch fails both HMCs lose connectivity, thereby defeating the HMC redundancy References:

C. SearchServiceClient

D. SearchCredentials

Answer: A,C

Explanation:

The various client libraries define classes like Index, Field, and Document, as well as operations like Indexes.Create and Documents.Search on the SearchServiceClient and SearchIndexClient classes.

Example:

The sample application we'll be exploring creates a new index named "hotels", populates it with a few documents, then executes some search queries. Here is the main program, showing the overall flow:

```
/ This sample shows how to delete, create, upload documents and query an index static void Main(string[] args)
```

```
{  
    IConfigurationBuilder builder = new  
    ConfigurationBuilder().AddJsonFile("appsettings.json");  
    IConfigurationRoot configuration = builder.Build();  
    SearchServiceClient serviceClient =  
    CreateSearchServiceClient(configuration);  
    Console.WriteLine("{0}", "Deleting index...\n");  
    DeleteHotelsIndexIfExists(serviceClient);  
    Console.WriteLine("{0}", "Creating index...\n");  
    CreateHotelsIndex(serviceClient); ISearchIndexClient  
    indexClient = serviceClient.Indexes.GetClient("hotels");
